Cornea and External Eye Disease The clear, protective, outermost layer of the eye is the cornea. Its dome shaped surface covers the front of the eye and is considered the most important tissue for vision. Along with the sclera (white of the eye), the cornea serves as a barrier against germs and other elements that can harm the eye's components. All the light that enters the eye is bent by ...

Cornea and External Eye Disease | USF Health

Cornea and External Eye Disease. The cornea is the clear outermost layer of the eye. It covers the pupil, iris, and anterior chamber. The cornea's main function is to refract light. The cornea is composed of proteins and cells. It does not have blood vessels, unlike most of the tissues in the human body. Blood vessels may cloud the cornea, which may prevent it from refracting light properly ...
